

GHG emission levels, Holmen Paper

Holmen Paper follows Swedish laws and regulations. Holmen Paper has a permit for CO₂ emission by law. CO₂ emissions are reported yearly to the Swedish Environmental Protection Agency.

For specific GHG emissions Holmen Paper mills can every year provide:

- 1) A Paper profile for each product group in May
- 2) A Carbon footprint for each product group (kg CO₂e/ADMT) in June

The mills at Holmen Paper have successively reduced the use of oil for heat production the last years. Since 2015 Hallsta does not use any oil for heat production and Braviken has reduced the use of oil by approximately 80 % during a ten-year period. The fall in oil consumption is largely attributable to improvements in the operational strategy for the steam system, greater efficiency in the solid fuel boiler and increased steam recovery from the production of thermo-mechanical pulp. These efforts help Holmen Paper products to perform a very low Carbon footprint.

For more information about the mills, please visit:

100% of the fresh fibre sources used at both mills are FSC® controlled wood or PEFC™ controlled sources. FSC®- and PEFC™ certified fibres are allocated to the orders of FSC®- and PEFC™ certified paper. Therefore FSC®- or PEFC™ certified products contain 100% FSC®- or PEFC™ certified fresh fibres.
